

CONTRIBUTE TO THE GLOBAL BATTLE AGAINST CLIMATE CHANGE

TRANSITION ENERGY SOURCE THAT IS SOUGHT AFTER ALL OVER THE WORLD

Did you know?

According to the International Energy Agency, nearly 40% of the world's electricity production comes from the combustion of coal, a highly polluting energy source.

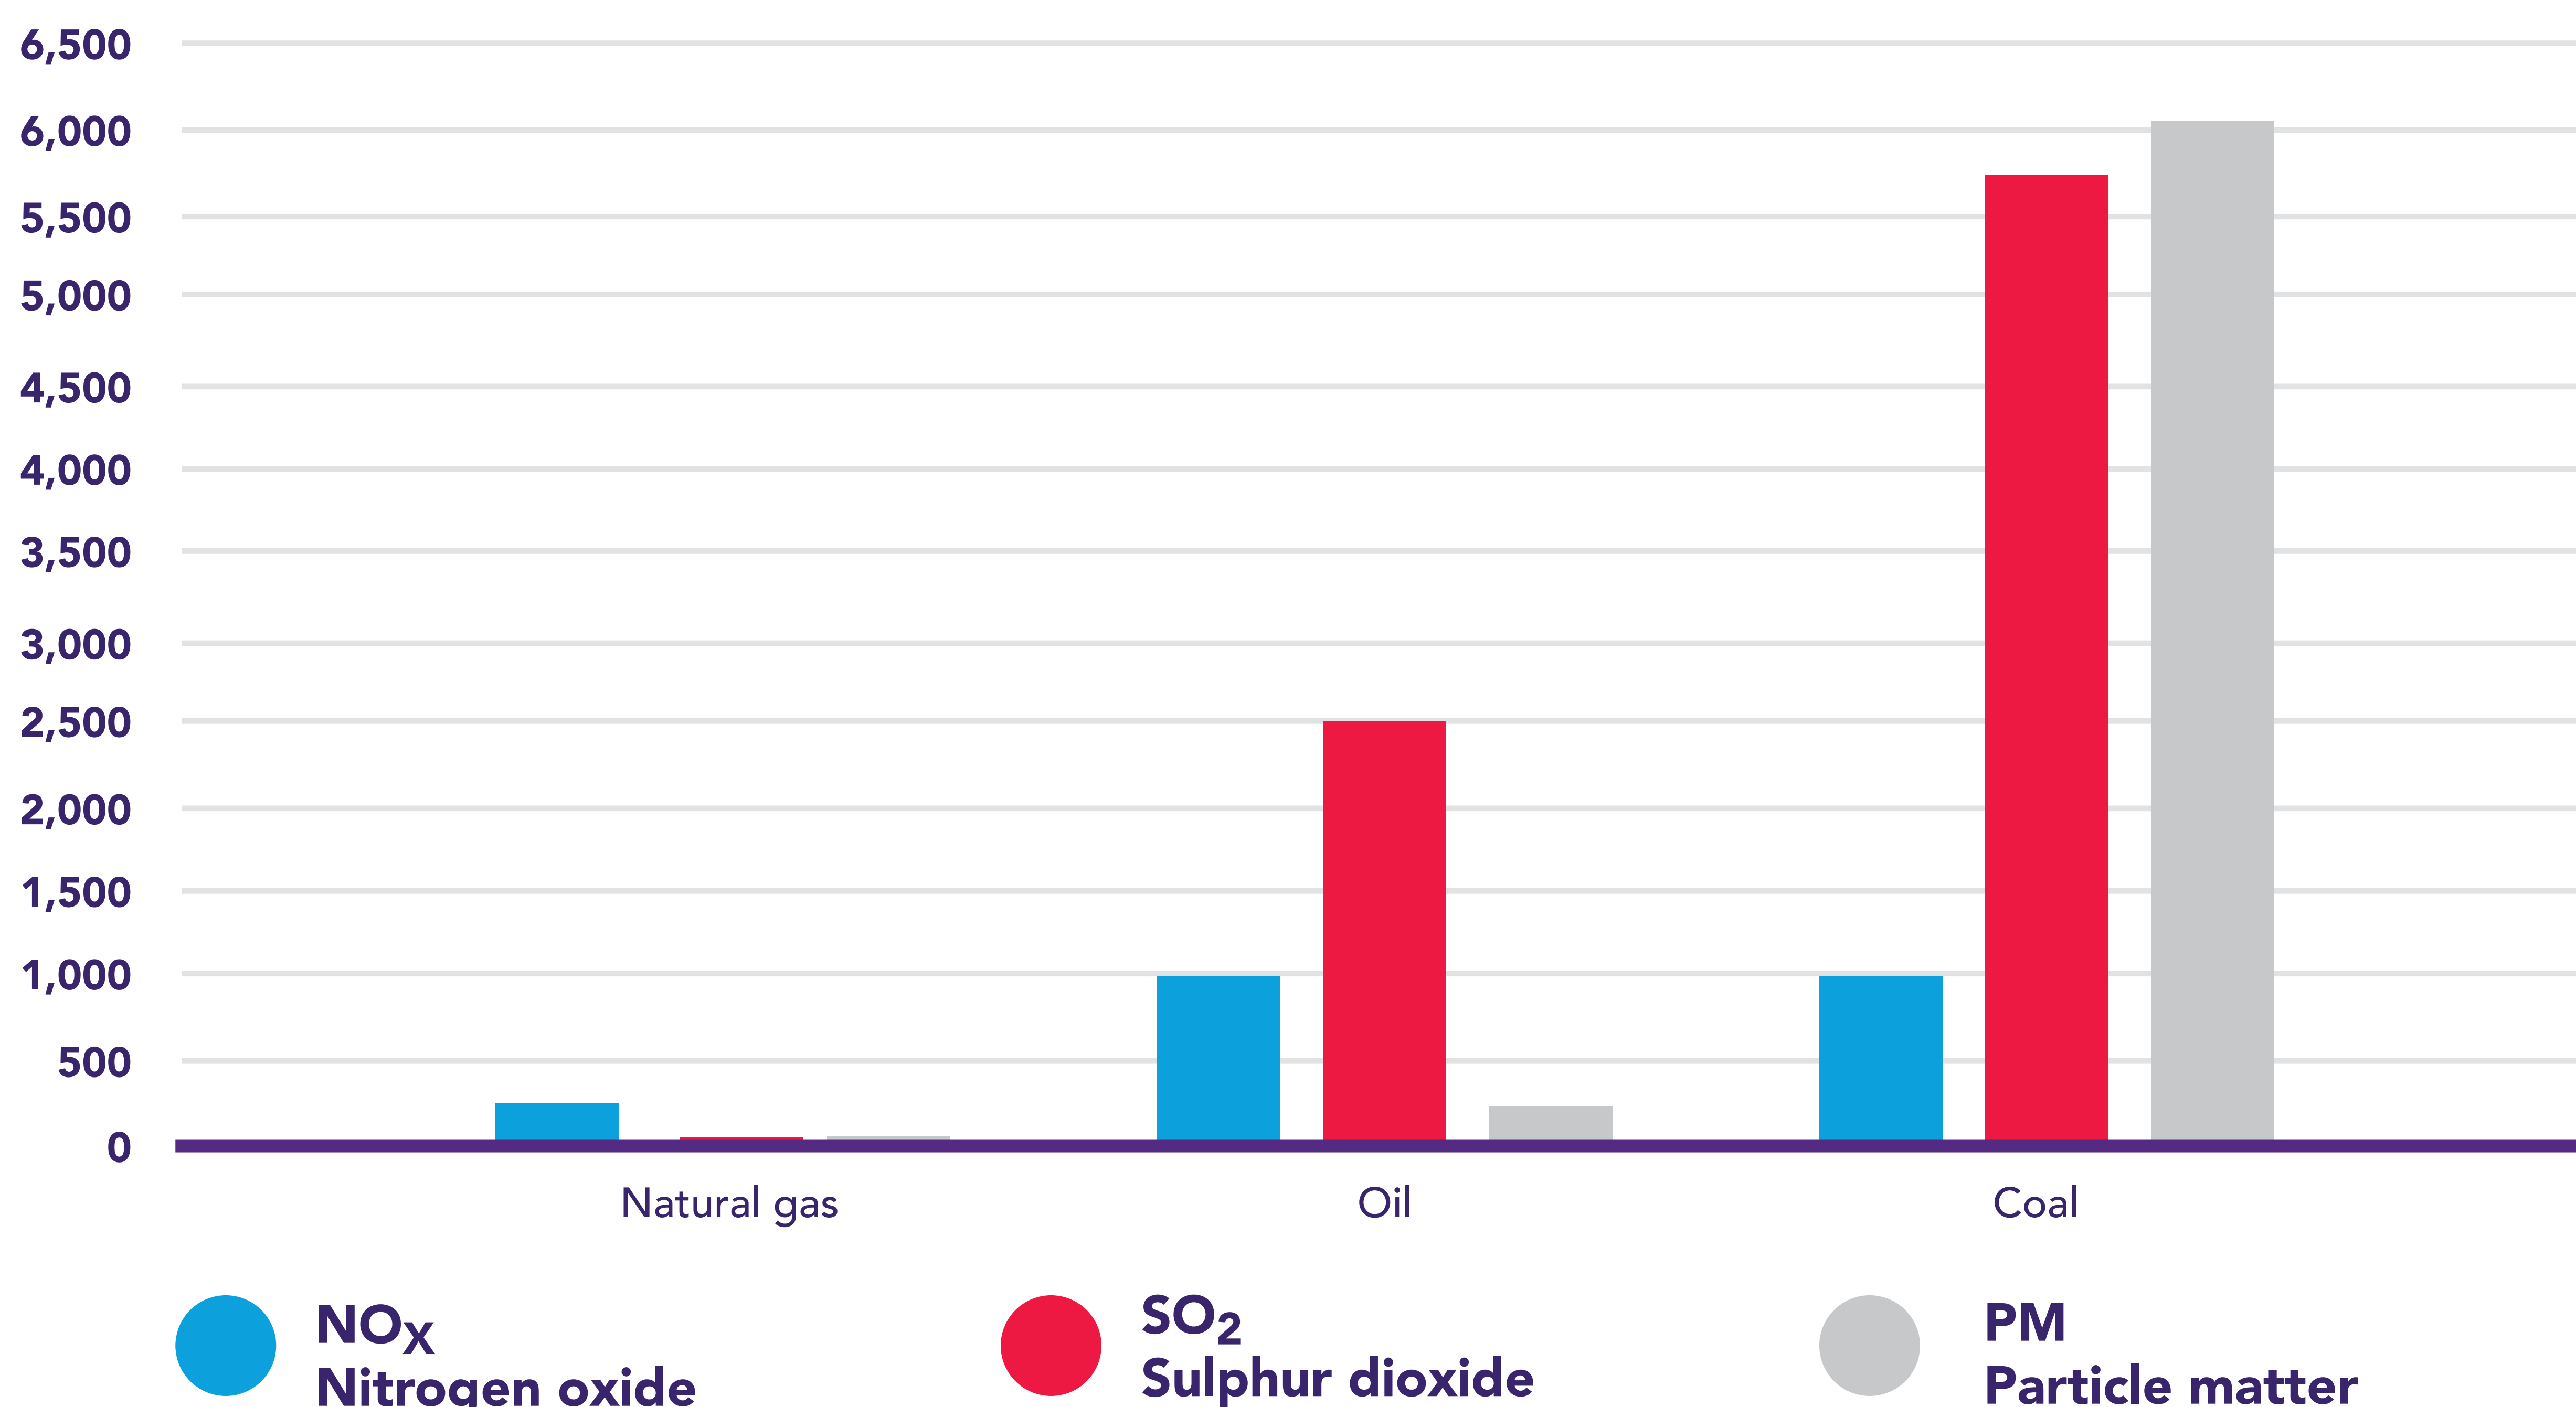

For electricity generation, replacing coal with natural gas would significantly reduce the emission of greenhouse gases and other air pollutants that are largely responsible for smog and acid rain.

Global demand for natural gas is growing rapidly because European and Asian countries are trying to diversify their energy supply, especially by using cleaner fuels to replace coal and petroleum.

EMISSION OF AIR POLLUTANTS DURING COMBUSTION

kg/ billion BTU consumed
