

INFRASTRUCTURE AND DEVELOPMENT

The project involves:

- ✓ **A natural gas line** (see image 1):
 - Made of high-strength steel
 - Coated in a protective layer of epoxy
 - 42 inches in diameter (about 1 metre)
 - About 750 km long
 - Buried at an average depth of 1 metre
- ✓ **A right-of-way of approximately 30 metres wide** (see image 2)
- ✓ **Compressor stations** (see image 3)
 - 3 to 4 stations, including one in Ontario
 - On Company owned property
 - Occupying an area of about 5 to 10 hectares
 - Compresses natural gas so it can travel long distances in the line
- ✓ **Block valves** (see image 4)
 - 25 to 30 valves occupying a perimeter 20 metres x 30 metres
 - Located inside the gas line right-of-way, at intervals of about 30 km
- ✓ **Metering stations** (see image 5)
 - One at the connection with TransCanada's network and one at each delivery point.
- ✓ **Roads to access the facilities**

The work areas will be cleaned and restored after the construction phase (see image 6)
